

What should you do After your Biopsy?

Wait 24 hours after your procedure before allowing the wound to get wet. After one day you should clean the wound with soap and water daily. After you wash the wound you should cover it with an ointment and a bandage. Keep the wound moist and covered. Proper wound care will accelerate healing and minimize scarring.

You will be notified of biopsy results by phone or via the online patient portal in the next few days. If you do not hear from us in 10 business days, please contact the office.

Unless otherwise instructed you should do the following:

- Wash the wound carefully with mild soap and water.
- After bathing, apply an ointment to keep the wound moist. This is a very important step. **Keeping the wound moist prevents scab formation. Scabs delay healing and increase scar formation.** Several recent studies have shown that plain Vaseline or Aquaphor are as good, if not better, than true antibiotic ointment.

Recommended products: *Aquaphor Healing Ointment, Vaseline 100% Pure Petroleum Jelly, Polysporin.*

- Cover the moistened wound with a Band-Aid or other non-adhesive dressing.
- Continue this routine until you return for suture removal. If you do not have sutures you should continue moistening and covering the wound instructed for 10 days

Call the office if:

- You develop a fever.
- You have redness around the wound.
- You see red lines extending away from the wound.
- You have pain. Discomfort should be minimal after most dermatologic surgery. If you are having significant pain it may be a sign of infection.
- You see pus draining from the wound. It is normal for a wound to be moist and slightly green/grey if properly cared for.
